Map Chromatin Topology at Ultrahigh-Resolution with the Dovetail™ Micro-C Kit, an MNase Hi-C approach.

- Generate the highest resolution data through an MNase based Hi-C approach
- Capture more information from A/B compartments to chromatin loops to nucleosome interactions
- Produce higher confidence data
- Generate more read-support per topological feature
- Reduce required depth of sequencing for cost savings

Phase Nucleosomes
Dovetail Micro-C libraries are enriched for DNA protected by nucleosomes enabling detection of nucleosome position.

A) B)

Coverage comparison of different Hi-C libraries A) averaged around CTCF sites and B) along a genomic region

Build the highest resolution contact matrices
Capture topology features from A/B compartments down to nucleosome interactions. Only Dovetail Micro-C enables detection of nucleosome positions and interactions

A) B)

Nucleosome-level resolution of chromatin contacts average across CTCF sites in A) Micro-C and B) Multi-RE Hi-C.
Maximize long-range data and read-support for topology features to save on sequencing cost

Micro-C libraries offer greater long-range information compared to other Hi-C approaches which, in turn, provides greater read-support per feature than other Hi-C approaches. The result is a reduction in sequencing cost for your topological studies.

Explore the anatomy of TAD

Micro-C’s nucleosome level resolution captures the full scale of chromatin conformation from A/B compartments to ultrastructure nucleosome-nucleosome folding. Call ~3-5 times more loops with only 800M paired-end reads including enhancer (E) and promoter (P) interactions.

A) Comparison of valid reads (cis > 1kb + trans) and percentage of long-range inserts captured in cis reads at <1kb, <20 kb, and <1 Mbp. Complexity is shown as percent of unique molecules sequenced at 300 million read pairs. B) Contact matrix at 4 kbp resolution at known loops from Rao et al., 2014. All libraries sequenced to 800 million read pairs.

A) Comparison of de novo loop calls with HiCCUPs between Hi-C approaches in GM12878 at 800M read pairs B) Explore the ultrastructure of topology by capturing sub-TAD features exclusive to Micro-C (blue features) including E-P/P-P stripes and dots, and extrusion weak pause sites, as well as the features captured in Hi-C (black features) of A/B compartments, TADs, CTCF-mediated loops and CTCF-cohesin mediated extrusion stripes.
